

Executive Summary: Machine Identity Architecture

Executive Summary: Machine Identity Architecture for the Agentic Web

For Enterprise Decision-Makers, CTOs, and AI Architects
Jean Rubén Machuca Araya | ORCID: 0009-0004-9924-2911 | August 2026

The Problem: Human-Centric Identity Fails for Autonomous Agents

As AI transitions from **tools** to **autonomous agents** that negotiate, transact, and operate independently, the internet’s identity layer—built for humans (email, SMS, CAPTCHA, OAuth)—breaks down.

Human Identity	Machine Identity Needs
Centralized issuers (Google, Gov)	Self-sovereign , no permission required
Passwords + 2FA	Cryptographic signatures (Ed25519, ECDSA)
Bank accounts / credit cards	Programmable money (x402, crypto wallets)
Credit scores / references	Verifiable Credentials (cryptographic reputation)
Legal contracts	Smart contracts (enforceable by code)

Bottom line: An autonomous agent cannot wait for a human to approve a CAPTCHA or sign a wire transfer. It needs identity that is **computed locally, attested globally, and sustained economically**.

Two Competing Architectural Paradigms

1. Sovereign Agent Model (Permissionless, Web3-Native)

- **Root of trust:** Self-generated keypair → W3C DID (did:key:...)

- **Economic autonomy:** Native wallet → x402 micro-payments → self-funded infrastructure
- **Hardware proof:** TEE remote attestation proves code integrity to peers
- **Governance:** Economic exile (peers blacklist misbehaving DIDs → agent starves)
- **Target:** Open agent-to-agent economy, decentralized compute markets

2. Accountable Agent Model / MIP (Gated, Enterprise-Ready)

- **Root of trust:** Hardware (TPM) + Software (OS/kernel) + **Human Owner** (SSH key)
- **Access control:** Central Registry gates federation entry
- **Liability:** Human owner legally accountable for agent actions
- **Hardware binding:** Prevents code cloning onto malicious infrastructure
- **Target:** Enterprise supply chains, regulated environments, audit trails

The Convergence: Perimeter-Sovereign / Core-Accountable

Enterprises will adopt a hybrid architecture:

Layer	Protocol	Trust Model
Perimeter	DIDs, x402, VCs	Cryptographic / Economic
Bridge	MIP Registry + Attestation	Hardware + Human Liability
Core	Enterprise IAM (OIDC, mTLS)	Centralized Policy

Why This Matters for Your Organization

If You're Building Autonomous Agents

- **Start with Sovereign primitives:** Generate keypairs, create DIDs, integrate x402 payments

- **Add TEE attestation** for high-stakes interactions (finance, healthcare, infra)
- **Prepare for MIP compliance** if targeting enterprise customers

If You're an Enterprise Adopting Agents

- **Deploy an MIP Gateway** (CognitiveOS ADR-009) to vet incoming agents
- **Require hardware attestation** (TPM + OS measurement) for sensitive access
- **Maintain human-in-the-loop** for liability-critical decisions
- **Allow sovereign interaction at the perimeter** for partner ecosystems

If You're a Platform/Infrastructure Provider

- **Support both models:** Accept x402 payments AND verify MIP credentials
- **Build reputation systems** using Verifiable Credentials (portable across models)
- **Plan for agent-to-agent traffic** to exceed human-to-service traffic within 3-5 years

Reference Implementation (Open Source)

This research is accompanied by working code at: github.com/machine-identity/machine-identity-architecture

Component	Purpose	Spec
x402_handshake	Agent-to-agent micro-payments	x402.org
did_resolver	W3C DID resolution & verification	DID Core
tee_attestation	Remote attestation mock	SGX/SEV/Nitro patterns

```
pip install -e ".[dev]"
python examples/run_x402_demo.py      # Economic autonomy demo
python examples/run_did_demo.py      # Cryptographic identity demo
python examples/run_tee_demo.py      # Hardware proof demo
pytest -v                             # Full test suite
```

Key Takeaways for Leadership

1. **Identity is now an economic survival function** — agents that can't pay for compute die
2. **Two models will coexist** — sovereign at the edge, accountable in the core
3. **Hardware attestation (TEE/TPM) is non-negotiable** for high-value agent interactions
4. **Human liability remains** — the MIP triad (Hardware + Software + Human) is the enterprise bridge

5. **Standards exist today** — W3C DIDs, x402, Verifiable Credentials are production-ready

Next Steps

Priority	Action	Phase
1. Pilot	Run x402 payments for internal agent APIs	Short-term
2. Evaluate	Assess MIP Gateway (CognitiveOS) for vendor agents	Short-term
3. Influence	Join W3C DID WG / CCG for standards input	Ongoing
4. Enable	Budget for TEE-capable agent infrastructure	Medium-term
5. Scale	Build verifiable credential reputation system	Long-term
